

## Exercise 8 | Menu Makeover

---

In this exercise we will explore the flexibility of CSS in formatting, typography and design. We have a menu written in HTML that contains several different tags including IDs, Classes and traditional HTML elements. The menu is rather plain, because it does not have a style sheet.

### Instructions:

---

Your job is to recreate the menu, by recreating the style sheet. The only condition is that you cannot change anything on the menu itself, only the style sheet. To give you a little bit more direction, you may be given an image that should inspire your design. The style sheet is called `menustyle.css`

You will have 1 hour to create your style sheet and we will be presenting our designs to the class. You are encouraged to chat with classmates for inspiration and ideas, but of course will do your own work.

- Download the menu html document
- Create a style sheet called `menustyle.css`

Not sure where to start?

Check out the links below, or chat with classmates to share ideas.
